                                                                                                                                                       individuals, including gene therapy and pharmaceutical intervention therapy. This sequence represents a variant of the wild type human 2-adrenergic receptor gene which is represented in AAZ00773.
                                                                                                                                                                                                              predicting a change in weight, using body mass index, can also be determined. The beta 2-adrenergic receptor sequence variants can be used to develop therapeutics and/or lifestyle drugs. Individual specific beta to develop the agents of the developed. Treatments can be optimized for agents.
                                                                                                                                                                                                                                                                                                 disposition, or migraine, allergic conditions, e.g. asthma and atopic disorders, and metabolic illnesses, e.g. morbid obesity including
                                                                                                                                                                                                                                                                                                                                        and Riley-Day syndromes having selective noradrenergic-receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                             gene sequences which have hypotensive, cardiant, neuroprotective and immunosuppressive activity. The products of the invention are used in a method to determine a predisposition for high blood pressure as well as for abnormal blood pressure and other cardiovascular diseases, including

This invention describes novel variant human beta 2-adrenergic receptor gene sequences which have hypotensive, cardiant, neuroprotective and immunosuppressive activity. The products of the invention are used in a method to determine a predisposition for high blood pressure as well as for abnormal blood pressure and other cardiovascular diseases, including
                                    anorexia nervosa and bulimia, or post-traumatic stress disorder. Disea of the autonomous nervous system, e.g. Bradbury-Eggleston, Sky-Drager and Riley-Day syndromes having selective noradrenergic-receptor disposition, or migraine, allergic conditions, e.g. asthma and atopic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         neuroprotector; immunosuppressor; predisposition; high blood pressure; cardiovascular disease; myocardial infarction; anxiety; depression; neuropsychiatric disease; attention deficit disorder; hyperactivity;
                                                                                                                                                                                  myocardial infarction and stroke. Other conditions that can be determined include neuropsychiatric disease, such as depression, attention deficit disorder with hyperactivity, eating disorders,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            8888888x&
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Matches
                                                  which is located on chromosome 5q31 (12). The gene has two different alleles, and it has been shown that the presence of two copies of the T allele leads to higher expression of the gene. This is because the polymorphism is found in the 5' leader sequence, which encodes a peptide which regulates expression of the beta2AR gene. The polymorphism is thought to affect individuals' responses to beta-agonists and beta-antagonists, and is likely to influence their predisposition to asthma, hypertension, congestive heart failure, ischemic heart disease, arrhythmia, obesity, diabetes, vascular disease, premature labour,
                                                                                                                                                                                                                                                                                                                                    Polymorphisms in the leader cistron (LC) of the beta 2-adrenergic receptor (beta 2 AR), useful for predicting genetic disposition to a disease modified by beta 2 AR expression e.g. congestive heart failure,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           individuals, including gene therapy and pharmaceutical intervention therapy. This sequence represents a variant of the wild type human beta 2-adrenergic receptor gene which is represented in AAZ00773.

The beta 2-adrenergic receptor sequence variants can be used
The gene can, therefore, be used to predict the susceptibility of an individual to these diseases and determine the best treatment.

                              and activity of proteins related to angiopoietin, 4-hydroxybutyrate, dehydrogenase, adenosine triphosphate (ATP)-dependent RNA helicase, major histocompatibility complex (MHO) Class I histocompatibility antigen and/or phosphoglycerate kinase. Disorders that may be prevented, alagnosed and/or treated by the above methods include multifactorial diseases with a genetic component, such as autoimmune diseases (e.g. rheumatoid arthritis, multiple sclerosis, diabetes, systemic lupus erytheromatosus and Grave's disease), inflammation, cancer (e.g. cancers erytheromatosus and Grave's disease), inflammation, cancer (e.g. cancers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            4-hydroxybutyrate; dehydrogenase; protein therapy; adenosine triphosphate-dependent RNA helicase; major histocompatibility antigen: MHC; phosphodycerate kinase; immunosuppressive; immunostimulatory; antirheumatic; antisclerotic; antidiabetic; antiinflammatory; cytostatic;
of the bladder, brain,
                                                                                                                                                                                       proteins have potential immunosuppressive, immunostimulatory, antirheumatic, antischerotic, antidiabetic, antiinflammatory, cytostat. antirheumatic, neuroprotective and antimicrobial activity and may be useful in gene/protein therapy, vaccines, modulation of the expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 20 BP; 0 A;
                                                                                                                                                                                                                                                                  nucleic acid single nucleotide polymorphisms (SNPs) and the encoded
                                                                                                                                                                                                                                                                                                           angiopoletin, 4-hydroxybutyrate, dehydrogenase, adenosine triphosphate (ATP)-dependent RNA helicase, major histocompatibility complex (MHC)
                                                                                                                                                                                                                                                                                                                                           The invention relates to nucleic acids (AAH79386-AAH80036) encoding polymorphic variants of proteins (AAG98010-AAG98238) related to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Polymorphic nucleic acids encoding e.g. angiopoietin, dehydrogenase, adenosine triphosphate-dependent RNA helicase and/or phosphoglycerate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              WPI; 2001-418297/44.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match
                                                                                                                                                         of mRNA from the nucleus to the cytoplasm, mRNA stabilisation, translational efficiency, and the sequestration of some mRNAs. Therefore modification of post-transcriptional protein expression in eukaryotic cells may be carried out through the targeting specific interactions of proteins that bind to RBPs. The gene fragments of the invention are used to identify their optimized sub-fragments, compounds that affect RNA/RBP interaction or mRNA functionality; or RBPs that interact with the compounds identified using the gene fragments are potentially useful for therapeutic regulation of gene expression, such as in cases of neurodegeneration; stroke; cardiovascular disease; hypertension; cancer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           be used to alter phenotypic traits such as longevity, appearance, strength, speed and endurance.

This sequence encodes the protein of the invention. The protein of the invention is a beta-2 adrenalin receptor subtype with Kd value of approximately 75 pM against 1251-cyanopindrol. The protein can be used in screening for agonists and antagonists, which are useful in researching
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel beta-2 adrenalin receptor sub-type - useful for screening for agonists and antagonists and researching asthmatic diseases

                                                                                                                                                                                                                                                       The present sequence is a fragment of the C allele of the human beta2 adrenergic receptor (beta2AR) gene, which is located on chromosome 5q31 (12). The gene has two different alleles, and it has been shown that the presence of two copies of the T allele leads to higher expression of the gene. This is because the polymorphism is found in the 5' leader sequence, which encodes a peptide which regulates expression of the beta2AR gene. The polymorphism is thought to affect individuals' responses to beta-agonists and beta-antagonists, and is likely to influence their predisposition to asthma, hypertension, congestive heart failure, ischemic heart disease, arrhythmia, obesity, and so the standard of the second congestive heart failure, ischemic heart disease, arrhythmia, obesity, and is the second congestive heart failure.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              mat_peptide

cc second alleles of the beta 2-adrenergic receptor gene and (b) classifying an individual as susceptible if first and second classifying an individual as susceptible if first and second alleles both encode Arg at residue 16 of the beta 2-adrenergic receptor gene alleles may be dentified by any known method e.g. denaturing gel electrophoresis or pck amplification (see also AAVS2615-17). Identification preferably comprises amplifying a portion of each allele which includes the sequence encoding residue 16, and optionally also comprises determining nucleotide sequences of these portions (e.g. to adverse determining nucleotide sequences of these portions (c.g. by automated sequence analysis). The invention identifies a known to adverse responses to regular beta-agonist administration; position 16 of the encoded protein can be either Arg or Gly, and individuals because of for xard and analysis of the encoded protein can be either Arg or Gly, and individuals because of for xard and analysis.
                                                                                                                                                            Query Match

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

RESULT 1 US-09-437-457-8/C

Sequence 8, Application US/09437457 Patent No. 6273893

GENERAL INFORMATION:
APPLICANT: Giordano, Anthony
APPLICANT: Xavier, Ashish
TITLE OF INVENTION: HOLLEIC ACID SEQUENCES AND METHODS FOR
TITLE OF INVENTION: INTERACTIONS THAT AFFECT RNA/RNA BINDING PROTEIN
TITLE OF INVENTION: INTERACTIONS AND MRNA FUNCTIONALITY
FILE REFERENCE: 50093/014001
CURRENT APPLICATION NUMBER: US/09/437,457
CURRENT FILING DATE: 1999-11-10
NUMBER OF SEQ ID NOS: 20
